recently picked up a cheapo digital camera. My wife wants to use it for creating pictures she can put up on the web as well as general snapshots of things in our world. Now she wants to be able to manipulate (re-scale, decimate resolution, crop) images and upload them to sites like Flickr.

The problem is, she is a *Magic user* when it comes to technology. Being the sadistic husband that I am, I've set her up with Linux. so far, she does okay with a few spells that I've given her. but to tell you the truth, I don't know what image processing application is simple enough for her to use. She's tried gimp and run away screaming. Any suggestions of what picture applications would be friendly for a magic user? Additionally, are there any tools one could use to perform a batch conversion on a set of images. For example converting all the images from the default resolution to a webpage friendly resolution.

try f-spot, available from universe in dapper and installed by default in edgy, and will do all of the above easily.
