Remote shell comes to mind. I don't know if the client is available in your windows version, I'm pretty shure it's in NT4 upward, but I'm not shure if it's in the "Home" versions.

You can use a DOS command (e.g. started by a Desktop Icon or someting in the Start Menu)

alt.linux: Re: Dial-up and Windows Networks

```
rsh -l linuxuser linuxbox "command"
```

to run a command on the Linux Box. You obviously will notice that there is no password given. But the command is executed only when the hostname of the sending machine is present in a file called `.rhosts` in the home – directory of the linux user. Otherwise the login is denied.

For more information have a look at "man rshd"

Tom
