Yes I having problem with it but the vast majority if not all the other  
people that have a interest in the site wouldn't know Linux if the Penguin  
jumped up and bit them.

Yes I did

and to answer your other questions.

The page uses 2 frames Top to hold the flash and Nav Bar.  
The bottom to hold the results

I wanted to do away with a side menu as the spoco results are wide and I wish to show as much of it as I can without the use of the scroll bars.  
hence the Java Applete was the only I could place the Nav bar in the top frame and have it over lay the bottom frame.

I do suppose that it could be done in HTML but not by me :( well not at the moment anyway.

Back to my first issue I am still unable to get the Java to work.

Ram
