I recently purchased 8.2 SuSe. In the install I get a rror and the 2 keyobard lights start blinking. I went ahead and replaced the motherboard think that it didn.t like the SIS chipset. I still am getting the same problem. I get one that says segmentation error, and or linus has crashed at a cerain address etc. I am running the following hardware and any help would be greatly appreciated:

P4 on a Jetway board with VIA chipset

512 meg ram pc 2700

Radeon 7000 w/64 meg ram

60 Gig HD

DVD drive

Sound Blaster 128 Sound card.

All I want to do is get this monster running....Any ideas what the problem might be? Thank you in advance.

Mark
