

# Wireless LAN – Trying to get SUSE, Linksys and Linuxant to work

I installed a wireless network, using a Linksys router (WRT54G) and card (WMP54G). The only thing in setup in XP was to change the network name from linksys to a new SSID.

I then found Linksys has no 800.11g drivers for Linux, and eventually I downloaded and installed the Linuxant "wrapper" and a Linksys Windows driver. As best I could, I tried to make the settings in YaST match the Windows setting (SSID, default gateway, leaving Host Name and Domain Name blank, etc.) with "Ad-hoc" as the network "type." So far everything seems OK. Linux "sees" the wireless LAN.

But, I cannot connect to the internet.

Has anyone had success with this type of setup and config? If so, how were you able to get it working correctly?

Thanks.
