David,

Many thanks for your reply. As of why the driver loads from my directory, that was just my mistake. I couldn't get the file via CVS, so I used the "snapshot" and got sloppy (was the 4th re-install) in 2 days. Anyway, I sort of figured out that the driver was there. Along the 3 previous installs, I tried a few things. If I choose to upgrade the Kernel from YOU the PC crashes completely and needed to re-install and I learned the hard way.

I tried updating the firmware from YOU only and it detected the card, but gave me the same problems. I then updates the driver from the Berlios site and did not work. Now, the card seems to be detected properly, iwconf... ives me a decent "signal", Mac address, access point address, etc. Seems to me like the problem is the card associating with the network. Mandrake uses the same driver (as per the /etc/modules.conf) and there it works. From SuSe I always get the:

```
Jul 16 16:26:25 susewireless1 kernel: wlan0: no IPv6 routers present
```

for some reason I am still to figure out.

Will it make a difference if I install the firmware from thekelleys website instead of the YOU version?

Thank you so much for your help. Any pointers will be greatly appreciated.

Diego J. Diaz
