Same here. There are TONS of various usability issues. I'm wondering if it's a problem with the Qt release that SuSE packages... so many people are glowing about this release, but in my experience it's been riddled with bugs.

Here's my list:

- Launching the "Run Command" dialog always takes you back to the desktop you first ran it on
- As you mentioned, the taskbar stops updating at times and needs reloading
- Ditto with system tray
- Ditto with desktop pager
- KDE System Guard only starts on screen 2 of my Xinerama display
- All screensavers but blank screen and banner are gone

> *Last night I upgraded tot KDE 3.3 coming from KDE 3.2.3. Looks great, but there are some niggles:*

> *- the panel/taskbar seems not to update any changes. The default is not to display open applications (and minimized applications are invisible in the taskbar and cannot be maximised) and I need to set that manually. After that it fails to remove closed applications from the taskbar so that will fill up...*

> *- the systemtray will not display at first. I need to select Remove Systemtray and then Add Systemtray to see it.*

> *- quite a lot of screensavers are missing. I see something happening when I click around in that module, but preview stays black and testing does not work. Do these screensavers come on top?*
