Hi,

I bought the new MX-1000 Mouse from Logitech. Its a great piece of Hardware: The first Laser / Wireless Mouse. Its working fine with SuSE 9.1.

It needs very little power and there is NO reaction time if you start moving it again after a while.

But: no support for additional buttons.

So, I phoned Logitech and asked for Linux drivers.

I: Our company plans to switch from Microsoft mice to Logitech.

Logitech: THats great, congratulations ...

I: ...but we recently switched to SuSE Linux because of all these security issues in Windows. So we need Linux drivers for Logitechs mice.

Where can we get them. Funny enough: we could not find them on your download page!

L: Er... Logitech does not support any Linux and won't do this in next future.

I: Thats a pity because everybody nowadays thinks about to change to a modern operating system, such as SuSE...

Not just us.

L: We only support Microsoft Windows and Apple Macintosh.

I: I see, so we have to look for other hardware suppliers.

L: If you need drivers they will be available from the Linux Community. Sooner or later. We are sorry.

I would suggest that any of you who has a Logitech product should fall on their nerves and keep asking for driver support.
