Hi all..

Have recently installed opensuse at work, and am interested in running dual monitors..

My video card accepts two monitors, one vga and one dvi. .

I've an dvi-vga adaptor, and currently have both monitors plugged in, though I'm getting the same image on both..

I've downloaded the ATI drivers (it's an ati video card), though I've ran through the configuration and it did not really do anything.. I've re-started the computer and am still with the same dual image..

Does anyone know how to do this?

Any help or guidance to the right direction would be great..

.
