Gerald I. Evenden wrote:

I pulled down the updates this morning which contained an update for the NVidia which I hoped may solve my resolution problem. After doing the update and rebooting the system my user screen came up rather odd. Clicking the screen icon showed a list of at least 20 resolution which maxed out at 1600x1050 which was currently selected (less than 10 selections were available prior to update). Thus my aspect ratio was off. Still no 1600x1200. To get a halfway decent screen I had to select 1280x1024.

Obviously, suse is still screwed up with this driver.

BTW: SaX2 shows:

Card: NVidia GeForce 6800 (0x00C1)  
Monitor: DELL 2001FP

which matches my DELL invoice.

I think suse should go and steal Mandriva's 2005LE driver as it worked fine on this hardware.

Any other ideas would be appreciated but I think the may be a difficult one.

I can get 1600 \* 1200 with my setup on OpenSUSE Slick ( 32bit )

AOpen 6800 Card on a Sony Multiscan 420GS 19" model running at 68 Hz abit slow for my taste so dropped it back to 1280 \* 960 @ 88 Hz

The driver was installed via YaST with 3D enabled

1600 \* 1200 is also the Max I can get in XP.
