I had to get rid of knetworkmanager, though – it couldn't handle fixed IP addresses and, when I changed to using DHCP, it couldn't handle a cloaked AP (no ESSID broadcast).

a mystery to me. it used to work fine on this old hp pavillion dv1000 (I just got in addition a dv2000) but suddenly it refuses to catch the wave.

I installed wifiradar which I discovered mucking with Kubuntu and now it's smooth sailing (again).
