Leslie Danks wrote:

I've just installed openSUSE 10.3 on a Fujitsu Siemens Esprimo notebook and everything is fine except for the network (LAN and WLAN). When I try to configure these YAST2 tells me "unable to configure network card because kernel device is not present" twice.

YAST2 -> Hardware -> Hardware Information shows a gigabit ethernet adapter with an active sis190 driver and also an Atheros 802.11 b/g wireless PCI express adapter (no mention of a driver).

lsmod shows that the sis190 module is actually loaded. I don't know what the Atheros driver should be.

Wireless is not so important at the moment, but does anyone have a suggestion for how I get the wired NIC up and running?

Further to the above, /var/log/boot.msg contains the following two lines:

```
sis190 Gigabit Ethernet driver 1.2 loaded
sis190: probe of 0000:00:04.0 failed with error -5
```

Any thoughts?
