I am looking to be able to print HTML documents from a linux command line via scripts (without user intervention) and I was wondering if you know of any tool that may do this. I have looked around the web for printing with Linux, but pretty much everything I find is for setting up printing, not actually doing the printing. I can convert the HTML if another tool will do that in the script. I also require that all the graphics, formatting, etc... be maintained.

A second question I have concerns the hard drive. Is there a compression program that works via the operating system to compress all stored files and expand them as they are used similar to the Compress option of Microsoft Windows? I am using a computer for the HTML documents that does not have a lot of hard drive space, and I would like to take advantage of the compression tools when storing the documents as text compresses really well. I need the tool to work without scripting though as people will be trying to view the documents via a normal web browser at times as well.
