You might want to start with the Linux ADSL Howto at

<http://www.rhapsodyk.net/adsl/HOWTO/>

I can't help you further – I've got an ethernet ADSL modem, which you can configure through a web-interface. After that, my server asks the modem for an IP address via DHCP, and the modem dials in and gives the real IP back to my server. Works like a charm.

The problem with the world is stupidity. Not saying there should be a capital punishment for stupidity, but why don't we just take the safety labels off of everything and let the problem solve itself?
