Hi

I am willing to deploy a solution where all the win2k operating systems would be running on a terminal server. The idea is to use old pc's that would boot with bootp/dhcp/tftp and load a very simple/light linux system that would then connect to a win2k terminal server and provide the win2k login windows; in such a way that users will not 'see' that they are running a linux system.

I have checked ltsp and all the related sites.

Do you have experience or comments with such an architecture ?

Many thanks for your answers
