Can anyone help? I am trying to set up a 900MHz machine with 3 sound cards. Each sound card has to have independent output channels. I have to be able to play multiple sound files per sound card.

It feels like I've tried everything there is out there. I have spent hours reading the .asoundrc documentation, the ALSA docs and everything that's closely related to this stuff.

I have ALSA installed, and aplay and other command line players work fine: I get sound from each sound card. Yet I want to be able to output different sound files per socket, so sound card 1 socket 1 would be sound file 1, sound card 1 socket 2 would have sound file 2 etc.

Can anyone please help?

This is my system setup:

RH 9.0

Alsa 1.06a

Sound cards: trident, ens1371, emu10k1

Thanks!
