I used to have a program called "Electronic Workshop" and it was great. You could put transistors, resistors, and all kinds of electronic parts on a board and then "run" the circuit to see how it would behave. It seems that some other fellow was so impressed with Electronic Workshop that he started a thing called "spice" which is the same thing only free for Linux.

Not quite. Spice is much older than Linux.

I downloaded the tarball, extracted it, did the ./configure, the make, moved all docs to "doc-pak" and then ran checkinstall "checkinstall -R make install". The thing failed miserably, were at make(5) by the time the thing gave up.

You haven't given enough information, but most likely you failed to install the build dependencies.

Yeah, I know, but there was so much shit wrong that it would take forever to try and grab a screencap of the make process. I just see tons of work ahead to try and get this to work and it might not work in the end anyway so I knew enough to just stop.

Hopwever, installing Spice from source is probably not what you want anyway. See if any of these packages are available from your Fedora repositories:

This sounds like an A1 idea, let me try that first and let you know how

Re: Anybody get spice to install on Linux?

Re: Anybody get spice to install on Linux?

it works. Thank you very much.
