Giganews isn't fooled by an incorrect Date header because they add their own. Your post for instance, has,  
NNTP-Posting-Date: Thu, 13 Mar 2008 16:06:16 -0500

months and months and one would get sick of seeing it and having to try and find the line where "the real new articles begin" every time one used one's newsreader in that particular newsgroup.

Huh? Hit 'd' and you'll never see it again. Or in Pan, you'd right click and "Mark Article as Read" Is there really such a thing as a newsreader without a comparable function?

Well I hit the delete button and I won't see the post anymore. People like us are somewhat Usenet saavy, I was thinking more about newbie readers actually.

That is annoying at the very least.

Simple remedy. Get a different newsreader.

I like Xnews for Windows, just wish it weren't so quirky sometimes because it is the closest thing to News Express that I could find. The Korean college kid that authored News Express abandoned it and now Xnews is what is left. I also use slrn, great for text reading, terrible for binaries.
