A new release, v.0.10.1, of CK-ERP, has been posted at SourceForge.Net, <http://sourceforge.net/projects/ck-erp> . A new VRM (vendor relationship management) module is included. It features vendor contract, vendor management center and vendor contact tracking functionalities. Logo is now formulated as embedded MIME object when emailed as part of a formal document.

This release has also been tested against eGroupWare 1.0.00.005 and found to be working satisfactorily. However Chinese GUI does not work when hosted in an eGroupWare environment because the default Chinese charset for eGroupWare is set to be utf-8 . At the same time, if multiple windows are being opened during the same session, the immediate last active window must be kept alive. If not, "Your session cannot be verified" error message will show up. The reason seems to be that the session id or some related critical session information is being hosted by the immediate last active window.

I should have mentioned this in v.0.9.1's release email. Contribution from James Hawkins in reporting a rather obscure bug occurring when tax is added to a non-tax transaction is greatly appreciated.

CK-ERP is an open source accounting/ERP/CRM system that runs on top of phpGroupWare. It comprises 18 modules – Admin, Contact Management, Customer Relationship, Vendor Relationship, Ledger, Bank Reconciliation, Inventory, Service, AP, AR, PO, SO, Quotation, POS for Cashier, POS for Manager, HR, Staff Self Service and Payroll. Operating platform can either be LAMP or LAPP. It provides accounting and back office functionalities to SMEs and utilizes phpgw to administer accounts/groups. Please report error and suggestion to the discussion group / mailing list, CK-ERP-en@googlegroups.com or CK-ERP-zh_CN@googlegroups.com . General history and expected development is available at the discussion group's Archive.
