Hi,

I find that I need to shut down (power off) and restart the computer after burning any dvd with growisofs (or any other utility that depends on it). Only after doing this can I burn another CD or DVD. If I don't do this the computer just hangs when attempting to burn and becomes unresponsive to any key pressed from the keyboard (not even alt-cntrl-del).

Chances are pretty good that you don't.

The reality is far more likely that you've simply jumped to the conclusion that you have to reboot to "fix the problem". The fact that rebooting does "fix the problem" doesn't mean it's the actual solution.

You've really not told us anything. You think there is some magic problem, and that rebooting will magically fix it.

You need to be looking in your logs to see what messages are being sent there. Likely there is a really good clue somewhere in there.

Until you can come up with real symptoms, nobody can provide a solution, because we don't know what's going on.

Michael
