i'm not sure if you meant 'ipconfig /all' for the XP box, but what's 'ifconfig /all' on linux?

anyway – the mtu's are:

linux: 1500

mac: 1280

xp: got nothing with 'ipconfig /all' – no mtu.

i'm not sure i know what this tells me?

maximum transmission unit?

maximum transfer unit?

all i know is the linux box continues to take forever to resolve websites.
