

Using a U.S. Robotics Fax modem with Slackware 10.0

I'm trying to get a U.S. Robotics 56K Fax PCI modem to work under Slackware Linux 10.0.

I tried using `/dev/modem` under KPPP but to no avail. I only get a log and the message that the modem is busy. On other ports (sorry can't remember now since I'm using windows) I get the message that slackware is trying to initialize the modem. I know that the modem is under COM3 but I didn't configure the Slackware installation to use a modem because I didn't have one at the time. How can I get the modem to work? I have no drivers either. I was told it didn't need any (and the box it came never had one). Windows supplies it's own driver, does Slackware? If not, where may I find a Linux driver (if I need it)? One reason why I am asking this is I have pay-by-the-minute Dial-Up and browsing is expensive, plus I'm still a Linux newbie)
