Hi all:

Something
very
strange.
All the
download
binary file
sudden can
not
execute.(Packages
installed by
PRM seems
OK.)
But they
were all OK
until some
stupid
things I've
done.

Re: HELP!! cannot execute binary file

The
message "
\$./filename:
cannot
execute
binary file"
come out
when
execute.

Cut and paste exactly what
you typed and what you got.

If you really typed
"\$./filename", don't do that.
(Leave off the dollar sign.)

Also make sure to use tab
completion when typing the
filename to make sure you
have the filename right.

I am using Ledora 5 linux.
filename means some executable.
\$>./filename
bash: ./filename: cannot execute binary file

Ok, it's telling you the file has execute permission,
binary content but is not actually an executable program.

Where did you get the file, what's its full name,
why do you think it's executable?

File A is a i686 binary from Atomeye.
This executable is test OK when I download it.
But it sudden do not executable.
And some pre-compiled binary has the same situation.
I am buring out.....

Re: HELP!! cannot execute binary file

Burning?

```
[jiunn@localhost bin]$ ls -ll A
-rwxr-xr-x 1 jiunn users 3599180 Feb 16 20:59 A
[jiunn@localhost bin]$ A
bash: ./A: cannot execute binary file
```

I think you've downloaded the wrong version of AtomEye.

I just downloaded the i.686 Linux version, here's what I got:

```
home> file A.i686
A.i686: ELF 32-bit LSB executable, Intel 80386, version 1 (SYSV), for GNU/Linux 2.2.5, statically linked, for GNU/Linux 2.2.5, stripped
home> ./A.i686
bash: ./A.i686: Permission denied
home> chmod +x ./A.i686
home> ./A.i686
Threaded atomistic configuration viewer V2.2 (C) Ju Li 1999-2004
Usage: ./A.i686 <PDB or CFG file>
```

I don't have a configuration file, but it runs.

I got the same out put for "file A.i686", but not "./A.i686" . see below

```
[home]$ file A.i686
A.i686: ELF 32-bit LSB executable, Intel 80386, version 1 (SYSV), for GNU/Linux 2.2.5, statically linked, for GNU/Linux 2.2.5, stripped
[home]$ ./A.i686
bash: ./A.i686: cannot execute binary file
[home]$
```

I just download again, but the situation is the same.
Something wrong with my Fedora 5 ??
Do you have any idear?

.
