I do live in New York City. I could probably get a burned DVD down the street. But! I worked it out. Roxio has moved on to some technology that its user fora don't care for very much. The way to burn an ISO to a DVD is to launch 'Creator Classic.' That's right -- they include an older version of their software as a tacit admission that the current version isn't going to meet one's needs. I guess it's great at arranging movies into menus, but I also failed trying to burn a TiVo recording.

Actually, like anything else, once you know how to do it, it's a snap. Launch 'Creator Classic' from Start/Programs/Roxio/Data and 'Burn from Disk Image File' is under 'Other Tasks' the second (of two) command grouping in the left pane. Browse to the iso file and you're off to the races.

So, I have a bootable DVD. I've booted from it, and got through the installation to the disk partition bit. I have officially passed this problem.

Thanks for the help!

burn menus. Last time I had to use Roxio, I was reduced to a gibbering screaming maniac before I found the !@#\$\$%^&\* option.

k3b is \*so\* much nicer.

I'd say that's some of the problem. The original poster is using software that I sure don't have, so what should be a simple thing, just looking at what's available, isn't an option for me, and likely others too.

This got me curious....

Roxio (at least the one on my XP box) installed about 20 \*different\* programs.

To create a CD/DVD from .iso, you don't use the disk creator, but the disk copier. <sarcasm> This should be obvious to everyone, right? </sarcasm>

Then you click on the "Advanced" option, and in the "Source" pane, you select "Disc Image or DVD video folder", click on "Select" and pick your ISO.

Then in the destination pane you select "Recorder", which, presumably shows your DVD burner.

Click on "Burn" and cross your fingers.

Like I said, k3b is much easier.
