Sam <sam@xxxxxxxxxxxxxx> writes:

There are GTK widgets that you can use as a blank canvas to paint on. GTK will do the heavy lifting and take of all the details. Look at the GtkDrawingArea widget.

See <http://library.gnome.org/devel/gtk/2.11/GtkDrawingArea.html>

My browser can't handle that site. I'll look at it next time I go to the library and use their computers. When you say that you can paint on it, do you mean I can paint interactively or do you mean that I can have my C program paint in it?
