Hi.

I use Gentoo the file-manager in Cygwin.

I want to give a special icon to a shell script and can't succeed.

The script name is xpsa.

So far, using the Configure pane, I tried to create a new file type (ie. Executable, xpsa), with the settings:

- Require type: File
- Require protection: Executable
- Match name (RE): xpsa
- Style: xpsa

and a new style:

Root > Executable > Tools > xpsa

and with the "Icon > Override parent's" button checked, I picked a newly created xpm icon.

But all this fails and the xpsa script keeps the original icon.

What am I doing wrong?

Thanks.

.
