I'm so sorry for confusing everyone in my previous posting. I hope this will be posted soon enough so you will not answer the old wrong posting.

Here is it again:

I was changing the hostname on my Linux box using GNOME. In my old posting I said I went into programs->network configuration->hosts and modified the line 127.0.0.1 localhost etc.

I didn't do that. I went into programs->network configuration->DNS and changed

Hostname entry to the name other than localhost.localdomain.

When I rebooted my graphical interface wouldn't start. I ran startX and went back and changed DNS->Hostname back to localhost.localdomain.

So my question is what's the proper way of changing hostname?

I'd like to use graphical interface to do that, but if need be I'll just change the proper files.

Again, I'm sorry for this confusion with my old posting. I'd be more careful next time.

Thanks
