Hi,

A while ago, I installed a NETGEAR FA311 PCI network card on my linux box, performed the standard installation (when the OS detected the new hardware and launched YAST for me), and connected to the internet just fine.

After rearranging things at home, I decided to attempt to install/configure a wireless network card. I tinkered with that for a while, realized I bit off more than I could chew, and went back to the original wired setup.

I can see other machines on my home LAN, but when I launch Konqueror and try to access the internet, it fails, telling me it is unable to load etc etc. I can ssh to other machines, ftp other machines etc etc.

The network card is setup as DHCP. ifconfig tells me the IP address is 192.168.0.4 (which is what I would expect). The NETGEAR router I am using is setup as a DHCP server and has other machines working properly through it.

What am I missing? Did my wireless journey somehow screw up some critical configuration file in /etc??

Ryan
