Hi,

I'm searching for a solution for a centralized server-system with single-sign-on with linux as operating system.

I just want the following services:

- fileserver with client-authentication
- printserver
- proxy-server (squid)
- VPN-System

It's important that there is only one central user-basis to administer that can be used for every service on the network. Beyond that it's important to be able to extend the environment with additional services which can access the user-basis as well even if they are on another server.

Is there any cost-free (and easy to set-up) solution for this scenario?

Thanks in advance,
Junialter
