Hi

I installed Yellow Dog Linux on my new playstation PS3. Generally, it's working fine. Unfortunately, I struggling in installing SW not included in the distribution.

One important example is Google Earth. When I try to install, the log only shows, that the archive has been extracted and then stops without an error message... nothing installed...

Does anybody has experience with installing Google Earth on Yellow Dog Linux and PS3?

Thanks a lot for every help!

Cheers, Salvi
