I have two systems both running Slackware 9.1 and Gnome 4.3.

The A system Gnome runs fine. The B system all of the characters in the windows display with pixels missing. It looks like braille, but is not. I have reloaded with identical results. During the reload I checked each Gnome package against what was install on the A system so I know they are alike.

The A system is a KT4V-L with an AMD 2200+ and the B system is a SOYO 5EMA with an AMD K6-2 at 500 MHz.

I also rebuilt XF86Config a couple of ways to make sure that wasn't the problem.

Any help is appreciated,

Razzle
