```
[compton ~]$ host 65.99.184.148
```

```
Host not found.
```

```
[compton ~]$
```

Well, you're really providing a lot of details so that people can help you. What kind of connection do you have? Dialin? DSL? Cable?

Mozilla is an application that uses the network connection provided by your operating system. Does your O/S *\_have\_* such a connection? What is the output of `/sbin/ifconfig -a` and `/sbin/route -n`? What do you find in `/etc/resolv.conf`? Your ISP appears to be United Systems Access in Kennebunk, but they don't seem to know how to configure DNS servers properly. They told ARIN that the name servers were run by `prexar.com` on `65.99.130.5` and `65.99.130.67`, so those addresses may be the ones that should be in `/etc/resolv.conf`.
