I have an nVidia GeForce 2 MX 400 64MB no DVI but am planning to get a newer 4000. This one works great in Slackware 10.1 at 1400x1050 24Bit. I have done many things, and recently installed the latest nVidia Drivers and it works even better now. Recently upgraded my Motherboard is why, the other board, only allowed AGP2X this one does AGP4X.
