Following up on Old guy's post, the other available address (81.10.53.21) must be a machine that has the routing information to your gateway otherwise you are stuck.

If you can ping that address, then find out from you ISP that is the gateway for your network segment and if not they need to give you the correct configuration or they need to verify the information you have. It is possible you may have have a typographical error ('typo').
