I can't fix this bug!

Red Hat Network has determined that the following advisory is applicable to one or more of the systems you have registered:

Complete information about this errata can be found at the following location:

Bug Fix Advisory – RHBA-2003:179-05

Summary:

Mailman RPM does not properly handle package installation and upgrade.

The mailman package for Red Hat Linux 9 does not properly handle package installations and upgrades.

Description:

Mailman is a mailing list manager.

The mailman-2.1.1-2 package shipped in Red Hat Linux 9 has an RPM installation bug that leaves a critical configuration parameter uninitialized, preventing the package from properly running after installation. On upgrade the package also fails to preserve the user's previous configuration file, resulting in data loss.

Users of mailman-2.1.1-2 should upgrade to the updated package, which is not susceptible to this issue.

Taking Action

You may address the issues outlined in this advisory in two ways:

linux.redhat: mailman-2.1.1-4.i386.rpm mailman-2.1.1-4.i386.rpm won't install

- select your server name by clicking on its name from the list available at the following location, and then schedule an errata update for it:

https://rhn.redhat.com/network/systemlist/system_list.pxt

- run the Update Agent on each affected server.

I tried the Update Agent which told me I was fully updated. So I then

```
downloaded: mailman-2.1.1-4.i386.rpm mailman-2.1.1-4.i386.rpm
[root@linux rhn-packages]# rpm -Uvh mailman-2.1.1-4.i386.rpm
error: mailman-2.1.1-4.i386.rpm: V3 DSA signature: BAD, key ID db42a60e
error: mailman-2.1.1-4.i386.rpm cannot be installed
```

```
[root@linux rhn-packages]# rpm -Uvh mailman-2.1.1-4.i386.rpm
error: mailman-2.1.1-4.i386.rpm: V3 DSA signature: BAD, key ID db42a60e
error: mailman-2.1.1-4.i386.rpm cannot be installed
```

Why won't the sucker install? I have the latest up to date rpms.
