Where did you get the RPM from? Some older vsftpd versions want to run as a service of xinetd(8), while newer ones want to run standalone. Which ever method was used, the RPM should have installed it correctly. Try a

```
# rpm -V vsftpd
```

to see if the install has been corrupted.

xinetd ain't inetd. Your setup file is bugged. Only the server pathname goes on the "server=" line. Use a "server\_args=" to supply any command line arguments for the server. You have one too many '}' brackets, also.

```
service ftp
{
    disable = no
    socket_type = stream
    wait = no
    user = root
    server = /usr/sbin/vsftpd nice
    server_args = nice = 10
}
```
