

Automatic mount on boot for iso9660 images

I am using redhat 9.0, and I am trying to mount some .iso images into the file system to share files out to the network. I have read several docs telling me how to do this, editing auto.misc, auto.master, and/or fstab. I am able to mount the images manually (using loop), but I have had no success at getting the images to mount automatically at startup.

I am getting frustrated, because I have tried the solutions in several docs, even re-creating the paths used in the examples (instead of what I am trying to mount) and I can't re-create the results illustrated in the docs.

Autofs IS running, so I can't figure out why I can't get it to work. Any help would be greatly appreciated.
